What's New In SCCM Client Center?

SCCM Client Center provides you with an easy to use application that comes in handy to SMS/SCCM administrators, assisting them in troubleshooting client related issues. SCCM Client Center can be used for accessing and modifying client settings, run certificate maintenance tasks, monitor events and actions, filter advertisements, repair the WMI, recreate the repository and so on. Solution: Solution contains a fully functional sample application which demonstrates all the features of SCCM Client Center. SCCM Client Center is an advanced SMS/SCCM client for troubleshooting SMS/SCCM administration issues on workstations and devices running Windows. It supports all Windows OSs from XP to Windows 10. SCCM Client Center is designed to be used by SMS/SCCM administrators to obtain information on client devices and their configuration in the Microsoft Operations Manager environment. The application makes it possible to monitor event log files, check the state of the application, manage client settings and run certificate maintenance tasks. SCCM Client Center contains built-in agents that periodically scan the operating system and retrieve information about client computers and related devices. The application can then be used to identify client machines, devices, applications and other resources, and in some cases assist administrators in restoring computer settings and using various tools. Some of the typical use cases of SCCM Client Center are: - Workstation scan. Perform a device, group of computers, or workstation scan to retrieve information about computers. - Client settings. Use the SCCM Client Center to monitor and modify client settings on workstations or servers. - Run certificate maintenance tasks. Performing a scheduled task on all workstations or a specific group of workstations. - Create a repository. Import information about client computers and devices from a text file into the SCCM Client Center repository. - View certificate related information. View certificate related information such as public and private key values, expiration date, owner, and subject information. - Repair WMI. Perform a WMI repair on workstations or servers. - Repair AD. Perform a search and repair of Active Directory entities on all workstations or a specific group of workstations. - Reconfigure clients. Perform an action on all computers or a specific group of computers. SCCM Client Center has a native client access API that lets you implement a custom interface for client users. This interface can be used to hide the application from client users, or to perform administrative actions behind the scenes. SCCM Client Center includes an Active Directory module that lets you synchronize the application state with a specific AD server. You can do this by updating the local SCCM Client Center repository, or by updating the AD information in the SCCM Client Center repository. The SCCM Client Center includes a generic component interface that can be used to obtain information

System Requirements For SCCM Client Center:

Minimum: OS: Windows 7/Vista/XP Processor: 1.6 GHz Intel Core 2 Duo or AMD Phenom II X4 Memory: 2 GB RAM Graphics: 256 MB of dedicated video memory DirectX: Version 9.0 Hard Drive: 3 GB available space Peripheral: Mouse Processor: 1.6 GHz
