Creating an image with Photoshop is based on layers; each layer has its own specific editing parameters. To edit an image using a layer-based approach, place the image on a new layer; then, you can edit that layer without affecting the rest of the image. By using layers, you can achieve incredible image versatility. A layer stack presents a three-dimensional view of the image that enables you to see the relationship between the top and bottom layers. You can manipulate one layer, then move it up or down in the stack to view how it affects the entire image. You can even manipulate the topmost layer without affecting the bottom layers. This chapter helps you create basic images with Photoshop. We help you understand how layers work and how you can create simple images that are easy to work with. In Chapter 4, we show you how to work with layers and how to apply effects to your images. In Chapter 5, we show you how to customize and create your own layers. The following steps show you how to create a basic image in Photoshop CS5: 1. Load your image into Photoshop. 2. Choose File⇒Open. Choose the image that you want to use. If you want to save the file, choose File⇒Save As. Browse and navigate to the folder that you want to save it to. 3. When the Open dialog box appears, locate the image on the hard drive by clicking the box next to its file name, as shown in Figure 4-1. 4. If you change the dimensions of your image window, you

We will walk through the different tools in Photoshop and Photoshop Elements to help you. We will also mention how you can use them together. 1. The Color Selector The color selector allows you to open a new file or open an existing image in the file format you choose. This means it can be used to open existing images. It does not import files. It is much more versatile than the old color menu. It is much easier to use for non-photographers. You can use the color selector to choose what type of file you want. You can choose the type of color space you want to work in. You can choose the color space based on the color space used in the image. For example, if the image was shot in the ProPhoto RGB color space, you can choose it. You can also use the color selector to select a color based on hue, saturation or lightness. You can search for a color based on shades of colors. You can use it to select colors in a bunch of different ways. This is a useful tool for designers and image editors. You can also use the color selector to choose a color that is not in the image. This is a handy tool for designing promotional images, logos, or artwork. The color selector is very easy to use. Here is how you use it. How to use the color selector: Click and hold the color symbol in the top menu until a list pops up. Click the color you want to choose. A pop-up window will appear. Click the color you want to choose. Colors – It is possible to choose the same color in different ways. Hue: Select a color by selecting the hue. have more than one email address? If we share the most important information with which other people have contact on the Internet, then, in the event of a hostile takeover of the business, the risk is increased exponentially. Therefore, all companies that have at least one email account and an Internet presence should have an appropriate legal framework for taking these risks into account. How do you deal with political issues? The first thing we do is understand the context in which our company operates, in our market. It's a market based on the double standard: one rule for the privileged, another for everyone else. So we look at the Spanish context, its economy, its markets and we see how our company fits into it. We don't want to be selective. We want to be as representative as possible of the Spanish market. We integrate the protections that are provided to us, but we do not aim to please. Also, we have a clearly defined international strategy, which we do not change according to the prevailing wind. It is a position which stems from the fact that we have a global culture and operating model, which makes it possible to present ourselves as a unified entity in such a wide range of countries. We don't do badly, we do well, we are more ambitious, but we don't overextend ourselves. We try to become significant in the countries in which we operate, but not worldwide. When we do something abroad, we do so at the same level as in Spain. Where do you see the business going in the future? Nowadays, we are not confronted with the disappearance of "digitalization". I do not believe that what we will be using next year will be different from what we are using now. Nor do I believe that what we will be using in the future will be different from what we are using now. The only thing that has changed is the way in which we interact with users. Our business model has changed. Our revenues are not only "those of the screen". We now have alternatives, such as e-books, apps for tablets and smartphones, and we have to be "digital" not only in the "traditional" sense, but also as a means of communication and of interaction with users. There are now revenues derived from interaction. There are now non-digital industries and industries which provide digital goods and

Q: Resize an image to new size and then recompress it? I am using ImageMagick on PHP 5.4.4-14. I am trying to create a command line program to resize an image to the desired size and then output the image but I only have the following command line: composite -resize 360x460^ -gravity center 'file' 'file2' Where both file and file2 are (and will be) valid file path. I need to resize the image first before outputting the new image as the output sizes are specific to the images I am processing. A: The ^ character is a comment for the next line... ^ Matches the beginning of a line. So you might also want to escape that like this: composite -resize 360x460/^ -gravity center 'file' 'file2' data = BoardFileObject.readData(file); // create a Polygon object for the drawPolygon() method board.polygon(data, points, fillColour, lineColour, vertexSize, vertexCapStyle, lineJoinStyle, lineCapStyle, fillPaint); // Finally we need to render the board (in this example just // the board and the polygon on the board, which is drawn to the // canvas) board.render(); // Create a Polyline style. This is used to control the colour // of lines drawn in the board var lineStyle = new PolylineStyle(strokeWidth, polyLineFill, polyLineColour); // Create a Line object to draw the lines in the board var line = new Line(points
