Electrical lighting devices utilize one or more electrical power supplies. The electrical power supplies are generally powered by a utility power source through the use of one or more electrical power cords. Each electrical power cord typically includes one or more electrical power wires and one or more one or

more electrical ground wires. Electrical power cords can be used with a variety of electrical lighting devices including, for example, table lamps, floor lamps, ceiling fixtures, bedside lamps, outdoor fixtures, and the like. One of the major problems with electrical power cords is that they are often cumbersome. The cords may extend from the lighting fixture to a remote location. Furthermore, the lighting fixture may be located in an area where it is not readily accessible. Due to the length of the electrical power cord, it is easy for the cord to be twisted, kinked, and tangled. A tangled cord may cause damage to the electrical wiring of the lighting fixture or to the electrical power supply. If the lighting fixture is located in a residence, the tangled cord may cause damage to a wall, a floor, a table, or any other area of a residence. Furthermore, the cord may present a tripping hazard. For example, the cord may fall into a dark area or down a staircase. The cord may be suspended between a ceiling and a floor, or may be in a pathway. The cord may present a tripping hazard to a person and may cause damage to the person or property. In addition, the cord itself can be difficult to handle. The cord may be covered in dust, dirt, hair, and the like. A person may need to clean or replace the cord on a regular basis. The cord may be exposed a1d647c40b
