Kill the Superweapon is a fast-paced arcade styled arcade shooter in a realistic 3D action setting. The levels in the game are built like a Sci-Fi movie diorama, where the action takes place on full 3D levels. The goal of the game is to navigate the facility, find the batteries, charge up the bomb, and take out the Superweapon. The action in the game takes place around the walls, providing a diorama like view. This diorama perspective and limited field of view, however, will frustrate some gamers, as it gets rid of the ability to run, crouch, or back away from the action. The goal of the game is to run, jump, and move fast through the levels to get to the Superweapon, and shoot him before he shoots you. In Kill the Superweapon, the player must navigate the facility, the facility's various levels, and find various Superweapons to destroy them. The Superweapons are moving around the facility on their own, and will chase you down. The player must navigate through the facility, fighting enemies, and avoid getting shot by the Superweapons before finding the battery-powered bomb to destroy the Superweapon. The game contains nineteen levels in five different zones. The game starts with the "Abaddon Lab" area, which is the initial zone of the level. In this area, the player must navigate through the facility, and search for a battery to power-up the bomb. The player then moves onto the "Rip-a-Thon" zone, where Sam needs to find the Nuclear Reactor to power-up the bomb. In the "Trap Zone" the player must navigate to the control room in the center of the facility, which can only be reached by traveling through a series of electrical wires. Then the player must travel through the elevator to the "Enforcements" zone, where the game will end if the player loses her superweapon. If

the player returns to the Abaddon Lab with the Superweapon still alive, the level is complete. If the player loses their superweapon while playing, the player will have to restart the level. If the player goes up against the Superweapon, they will most likely lose. The game is split into 3 parts. Part 1 is a prologue, following the early days of Samantha Kill. In Part 2, she is nearing the end of high school, and in the final part, she graduates and goes to college. Spoiler: If you have played any of the other games in the Kill series, then you probably know what I'm about to say, but in case you don't, Sam's going to college. I'm really proud of this, because although I'm still in high school, I actually know how to type and I had a hand in this game. You'll see in just a bit. Characters Samantha Kill: She's an 18 year old high school senior and the main protagonist of Kill the Superweapon. She's the daughter of a scientist who was working on creating a game called "the ultimate game" before he died in a car accident. Her dad left her an experimental infrared gun that he was working on, and it was this gun that led her to the Abaddon Inc. labs where the power pack for the Total Ablation Beam was being created. Samantha's best friend, Kylie, is waiting at the local high school for her to get home. Like Samantha, Kylie loves video games and is also a huge Sam fan. What's new:

In October, paper backup storage giant EMC released its annual report on its profits, revenues, and net profit margins. In its press release, the company concluded, "The global IT backup market is improving, as is the case with storage prices. This helps EMC as we move into a transition in the industry, enabling us to move forward and grow." Coming from a company that spent 30 years solidly being mentioned as the storage company to beat, the remark is an interesting one. The NASDAQ-listed company may have silently run its business into the ground, but its StorageMAX line of products remains the storage industry's most popular solid-state drives (SSDs). EMC's disk drive profit margin plummeted from a 75 percent margin in 2000, as disk prices were dropping, to only 17 percent in fiscal year 2009. Backup sales for large organizations comprise only one small segment of IT budgets--generally running 5 to 10 percent to the customer. But over the life of a company, the cost of a backup solution can be very high, and several security breaches in 2007 and 2008 revealed that organizations were underprepared to prevent the problem from reappearing. The first indication that EMC's storage business had a problem was a letter from the company to The Register back in September, when EMC admitted it was seeking a partner to develop network-attached storage (NAS) extenders that will drive performance even when the central EMC StorageMAX storage array begins to fail. That extender is the key to EMC's future and where it may become a strong competitor for RAID controllers such as Dell'Azio's

Supreme Storage Express system. The firm initially wanted an NAS driver, but eventually it settled on a new solution, which began with small pilot projects with tier-1 data centers. In its fiscal 2009 third quarter report, EMC revealed that its efforts were growing into a more serious effort. In its press release that same month, the firm noted, "We are currently piloting new technologies which, if successful, will be introduced in the second half of 2010." Mustering up the strength In a recent interview with The Register, EMC's CEO Joe Tucci conceded that the firm had been seduced by the "buy low and sell high" strategy that caused its stock to drop sharply in 2008. "We were fundamentally under-pricing what we were good at," he said. "We kept buying things we weren't as good at, and they got
