What's new in Elden Ring:

Hey I'm Jerry :D I am currently a Computer Science major at California Polytechnic University. I have been playing WoW since late Alpha and NCSoft has been my favorite game company to date. So naturally, I joined the World of Warcraft website today to share what I know about WoW and give experience to you my fellow WoW'er.The present invention relates generally to a semiconductor memory device. More particularly, the present invention relates to a semiconductor memory device including an amplifier circuit for amplifying data to be read out, and also to a low-voltage voltage generator capable of operating at a voltage lower than an external voltage supplied to the semiconductor memory device. A dynamic random access memory (DRAM) includes a memory cell array of memory cells each having a single transistor and single capacitor. Typically, in such a memory cell array, memory cell signals are stored in bit lines connected to the memory cell array and word lines connected to the memory cell array. These bit line and word line applied word line signal levels change according to the data stored in the memory cell. That is, when one bit line is selected and the word line connected thereto is applied with a selected level, data is read in the memory cell connected to the selected bit line. As a result, the voltage of the selected bit line changes to a logic high or low voltage according to the data stored in the memory cell. To perform a read operation of data stored in the memory cell, the bit line connected to the selected memory cell is precharged, and the word line connected to the selected memory cell is changed to an active level by raising the applied voltage. When the word line rises to the active level, and the potential of the bit line is raised, the data of the selected memory cell appears on the bit line. In

the conventional DRAM of this type, however, when the bit line is precharged and the word line is changed to the active level, a current flows via a metal-oxide semiconductor (MOS) transistor belonging to the memory cell and the bit line, and the voltage on the bit line substantially decreases. This decreases the accuracy of data read out from the memory cell. To overcome this problem, a DRAM amplifier circuit applied as an input circuit is required. Such an amplifier circuit amplifies a bit line signal as a word line signal to suppress the decrease of the voltage on the bit line. For example, such an amplifier circuit is disclosed in Japanese Patent Application Laid
