
Movie Online.. Blu Ray 2 Disc .Q: Accessing kubernetes type and kind in Prometheus? I want to display the prometheus scrape metrics as a graph in UIs. One of the metrics that we scrape in kubernetes is type and kind. So using the label selector I can filter data which is related to the pod and their replicas. Is there any other way we can display that particular metric in UI? A: Is there any other way we can display that particular metric in UI? There are no other ways to display it in the UI, except for providing a Prometheus rule for that metric (e.g. for the hostname label). That is, for a set of pods or containers, Prometheus is scraping that metric from the corresponding Prometheus instance running inside the pod. There are a number of reasons to have a Prometheus running inside Kubernetes: Prometheus is a lightweight daemon, while a Prometheus server is usually a full-blown monitoring solution including several daemon processes which need to be started for every Prometheus instance. If you want your Prometheus instances to consume large amounts of time or are deployed in many places, there is a possibility to offload some of the processing to other Prometheus instances. Kubernetes provides primitives to expose these Prometheus instances which are usually accessible through the Kubernetes API server. You'll find more information in the Kubernetes docs about Prometheus. //===-
